Gustavo Abreu contribution statement

CommunityConnect | CS 690 | For personal review before signing

Personal authorship

I supplied the project direction, technical-stack preferences and instructions for using the CommunityConnect GitHub repository, Jira and the AISE workflow. I confirmed my interview participation and the supplied INT-02/INT-04 note-validation and permission facts, corrected the team roster, and reviewed PS-3, PS-4, PS-7 and PS-8 against the original records. I explicitly accepted those four claims and the disclosure for team review. I supplied the bounded implementation approvals recorded in the repository, required merged-branch cleanup, selected a local browser preview, accepted the bounded S-1 behavior on November 8, and confirmed that board approval is required for each target community before manager announcements.

I subsequently approved the bounded S3-AC12 manager community-options API and S3-AC11 selected-community requests API packets, including their contract tests and CI phases. These API increments are merged. I authorized PR18's documentation merge and branch cleanup, and conditionally approved the S3-BROWSER-1 scope after Kundan's COMC-69 and Sandeep's COMC-70 acceptances. I requested a multi-agent approach under that same condition. At the recorded November 8 check, both reviews remained pending and browser implementation had not started. These later local API increments and browser plans do not expand the original S1-only Milestone 1 submission boundary or constitute full-story acceptance.

I must add any additional text or code that I personally wrote, with its source, before signing. This draft does not claim that I personally wrote the AI-generated application, tests, documents or audit scripts.

AI assisted authorship

I used OpenAI Codex to help extract and organize supplied notes, draft personas and requirements/designs, format the milestone/progress materials, maintain Jira, implement the approved local S-1 API and contract tests, and prepare verification and provenance evidence. The repository records task-specific approvals and actual checks. Relevant ledger records include Entries 1–7 for setup/preparation, Entries 8–15 for approved tests-first AC1/AC2/AC4 work and verification, Entries 16–20 for review, preview and AC5/fresh-clone evidence, and Entries 21–23 for the traceability/provenance/private-evidence handoff. Entry 24 records AI assistance in preparing this contribution draft and submission checklist. Exact final commit references are in the ledger and Git provenance notes. Exact model build/version is unavailable and is not guessed.

Codex also prepared later feature plans and implemented the approved S3-AC12 and S3-AC11 APIs and their tests. Ledger Entries 25–38 record those plans, approval decisions, AC12 execution and AC11 preparation; Entries 39–42 record AC11 tests-first execution, CI evidence and observed integration. Entries 43–44 record PR18 review/merge and conditional browser scope approval. Entry 45 records a coordinator and two AI agents performing read-only browser test/infrastructure preparation. Those agents did not implement the browser, execute its proposed tests, or supply Kundan's or Sandeep's human acceptance. The current contribution and submission refresh is also AI-assisted; I must review its wording before signing.

Earlier fictional interview rehearsals were used for question preparation; their answers are excluded from interview evidence. The real-interview notes and reviewer records remain separate. Remaining teammate decisions are not represented as completed.

Review

I reviewed the four assigned persona claims (PS-3/4/7/8) and accepted their source claims and proposed interpretations as reasonable, preserving unresolved product questions. I accepted the disclosure as suitable for team review. On November 8, I explicitly accepted the bounded S-1 behavior after the review report in PR12 was presented: creation, validation, community/submitter isolation and reading stored status. That historical S1 fresh-clone and CI checkpoint reports 120 passes, zero failures/errors and five intentionally deferred S-6 tests. The later API baseline, including the merged S3 increments, reports 200 passes, zero failures/errors and the same five S6 skips; it is a different scope and does not replace the historical S1 evidence. The proposed 30 browser/startup cases have not run. I am not claiming that I personally executed those automated checks or independently inspected every line of code. The AI review identified stale design text and a missing reviewed gapcheck; independent team review and final submission evidence remain separate from CI success.

Before signing, I will verify every statement, identify any additional actual review I performed and correct anything I cannot personally attest. My signature will not certify the pending team reviews or a production release.

Preparation status, November 8: COMC-46 is In Progress and no statement attachment was observed in that ticket. This unsigned draft is available for my review; it is not an individual submission confirmation.
